

electronics, petroleum refining, paper, chemical, and related industries. Most others worked for engineering services, research and testing services, or consulting firms that design chemical plants. Some also worked on a contract basis for government agencies or as independent consultants.

Job Outlook

Chemical engineering graduates may face keen competition for jobs as the number of openings is projected to be substantially lower than the number of graduates. Employment of chemical engineers is projected to grow as fast as the average for all occupations through 2008. Although overall employment in the chemical manufacturing industry is expected to decline, chemical companies will continue to research and develop new chemicals and more efficient processes to increase output of existing chemicals. Among manufacturing industries, specialty chemicals, plastics materials, pharmaceuticals, and electronics may provide the best opportunities. Much of the projected growth in employment of chemical engineers, however, will be in nonmanufacturing industries, especially services industries.

Earnings

Median annual earnings of chemical engineers were \$64,760 in 1998. The middle 50 percent earned between \$49,360 and \$81,520. The lowest 10 percent earned less than \$41,380 and the highest 10 percent earned more than \$92,240.

According to a 1999 salary survey by the National Association of Colleges and Employers, bachelor's degree candidates in chemical engineering received starting offers averaging about \$46,900 a year; master's degree candidates in chemical engineering, \$52,100; and Ph.D. candidates in chemical engineering, \$67,300.

Civil Engineers

(O*NET 22121)

Nature of the Work

Civil engineers design and supervise the construction of roads, buildings, airports, tunnels, dams, bridges, and water supply and sewage systems. Major specialties within civil engineering are structural, water resources, environmental, construction, transportation, and geotechnical engineering.

Many civil engineers hold supervisory or administrative positions, from supervisor of a construction site to city engineer. Others may work in design, construction, research, and teaching.

Employment

Civil engineers held about 195,000 jobs in 1998. Almost half were employed by firms providing engineering consulting services, primarily developing designs for new construction projects. Another one third of the jobs were in Federal, State, and local government agencies. The construction industry, public utilities, transportation, and manufacturing industries accounted for most of the remaining employment. About 12,000 civil engineers were self-employed, many as consultants.

Civil engineers usually work near major industrial and commercial centers, often at construction sites. Some projects are situated in remote areas or in foreign countries. In some jobs, civil engineers move from place to place to work on different projects.

Job Outlook

Employment of civil engineers is expected to increase faster than the average for all occupations through 2008. Spurred by general

Civil engineers take safety and environmental concerns into account when designing construction projects.

population growth and an expanding economy, more civil engineers will be needed to design and construct higher capacity transportation, water supply, and pollution control systems; large buildings and building complexes; and to repair or replace existing roads, bridges, and other public structures. In addition to job growth, openings will result from the need to replace civil engineers who transfer to other occupations or leave the labor force.

Because construction and related industries—including those providing design services—employ many civil engineers, employment opportunities will vary by geographic area and may decrease during economic slowdowns, when construction is often curtailed.

Earnings

Median annual earnings of civil engineers were \$53,450 in 1998. The middle 50 percent earned between \$41,800 and \$74,550. The lowest 10 percent earned less than \$34,270 and the highest 10 percent earned more than \$87,350. Median annual earnings in the industries employing the largest numbers of civil engineers in 1997 were:

Federal government	\$64,000
Heavy construction, except highway	61,300
Local government, except education and hospitals	52,100
Engineering and architectural services	49,300
State government, except education and hospitals	48,900

According to a 1999 salary survey by the National Association of Colleges and Employers, bachelor's degree candidates in civil engineering received starting offers averaging about \$36,100 a year; master's degree candidates in civil engineering, \$42,300; and Ph.D. candidates in civil engineering, \$58,600.

Electrical and Electronics Engineers

(O*NET 22126A and 22126B)

Nature of the Work

From computer chips that process millions of instructions every second to radar systems that detect weather patterns days in advance, electrical and electronics engineers are responsible for a wide range of technologies. Electrical and electronics engineers design, develop, test, and supervise the manufacture of electrical
